

**JANUARY 26, 2010
FOR IMMEDIATE RELEASE:**

Oceanside, CA... Nitto Denko / Hydranautics announces its release of IMSDesign2010.

IMSDesign2010 is the latest version of Hydranautics' projection software, a software tool created to meet the most demanding needs of the membrane industry professional. IMSDesign2010 is a comprehensive membrane projection program that allows the user to accurately design an RO system using the latest in Hydranautics membrane technology. This program is a powerful tool for designing an integrated membrane system, providing many new features which enhance the user's ability to quickly and accurately design and analyze various RO desalination systems. IMSDesign2010 builds on the new features provided in IMSDesign2009, which included simulating the effect of energy recovery devices on RO performance, ability to run a predefined batch of projections, and modeling of 16 inch diameter RO elements. These were all "firsts" in our industry.

IMSDesign2010 has been enhanced with an improved Temperature Correction Factor for more accurate performance projections of seawater membranes at low temperatures, an ability to correlate Flux Decline & Fouling Factors, more stable turbo booster calculations, and the ability to model an interstage turbo and interstage booster pump in series. The program will also include new elements being released for commercial sale. Finally, significant improvements have been made to the language translations for ease of use by our valued international customers.
